

Delta Exchange

Product Manager research package

Trust and explainability as the next derivatives + automation moat

Final public-source package | 16 July 2026

Use for: executive outreach, PM interviews, product case discussions

Executive thesis

The strongest PM story is not feature volume. It is confidence when users are under financial stress.

Delta appears to have assembled a broad public stack:

- INR-native derivative trading proposition
- Futures, options and current public spot claims
- TradingView, API, Bot, API Copilot and Algo Marketplace
- Security and withdrawal support surfaces

The product opportunity:

Make every trade, fee, withdrawal and algo decision explainable and auditable to the user.

This converts trust from a support function into product differentiation.

What changed through research loops

Public evidence points to a sharper opportunity than a generic company profile.

Initial view

**Delta as a crypto
derivatives
exchange**

Updated view

**Delta as an INR-native
automation pathway**

PM challenge

**Make automation safe
and trading outcomes
explainable**

Manual trading → TradingView → API → AI Copilot → Bot/Marketplace

Public product-truth gap

A high-trust financial product cannot let users reconcile product scope from scattered surfaces.

- Fee page includes a spot row
- App listing publicly markets spot trading
- Terms define digital-asset wallets and custody services
- Security/help language should be reconciled with current product state

Recommendation

Public Product Truth Audit

A single current, entity-aware matrix for products, fees, custody, availability, risk and support language.

Fast, low-engineering trust win

Where users lose confidence

Visible reviews and support themes are directional, not prevalence data.

Execution Did my order / stop / liquidation happen correctly?

State Is the app showing the truth right now?

Money Where is my withdrawal?

Economics Why did my P&L change after fees?

Recovery Why does support lack context?

Core user job: prove what happened.

Competitive position

Delta should out-specialize broad platforms, not out-broaden them.

CoinDCX / Mudrex

Broad crypto platforms

Pi42

India F&O specialist

Deribit

Global pro benchmark

Delta wedge

INR-native derivatives + automation + explainability

This creates a PM narrative that is sharper than generic growth or feature parity.

Recommended north-star and guardrails

Do not optimize only for sign-ups or raw volume.

North-star metric

30-day retained funded traders with successful activity in at least two separate weeks

Segment by native terminal, TradingView, API, Bot and Marketplace.

Guardrails

- Order acknowledgement success
- Stop trigger integrity
- Stale market-data exposure
- Withdrawal P95 by reason
- Fee/P&L support contacts
- Severe avoidable liquidation rate

Opportunity ranking

Directional RICE-lite scores; validate with internal analytics.

Why product truth ranks highest

- Fast to ship
- High-confidence evidence
- Cross-functional trust impact
- Reduces support ambiguity
- Improves executive credibility

Trade Integrity and Algo Safe Deploy are deeper moat builders.

Proposal 1: Trade Integrity Center

The product answer to: “what exactly happened?”

- Event timeline for orders, triggers, fills, liquidations and balance movements
- Market context at the moment of action
- P&L / fee / funding / GST reconciliation
- Incident linkage and support export

Success signals

- Trade-dispute tickets down
- Resolution time down
- Reopen rate down
- Trust score up after volatility

Build from authoritative backend event logs, not reconstructed client state.

Proposal 2: Explainable Trade Economics

Make net outcome legible before and after the trade.

Before trade

- Entry fee
- Estimated exit fee
- GST
- Funding exposure
- Break-even move
- Liquidation distance

After trade

- Gross P&L
- Fees
- GST
- Funding
- Settlement/liquidation
- Net balance change

PM principle

Sophisticated derivatives should be understandable without becoming irresponsible.

Proposal 3: Algo Safe Deploy

Convert API Copilot into a safe deployment pathway.

Idea → Code → Testnet → Guardrails → Live → Monitor

- Static checks for unsafe order sizing and missing error handling
- Testnet observation before live deployment
- Capital, loss and order-frequency limits
- Kill switch and live deviation monitoring
- Marketplace Trust Scorecard for live vs paper vs backtest performance

This is how Delta turns automation into a defensible, safer ecosystem.

Recommended 90-day PM plan

Start with trust clarity; build toward differentiated automation.

0-30 days

Product Truth Audit
Instrumentation plan
Support taxonomy

31-60 days

Explainable Trade Economics
MVP
Withdrawal status
improvements
Support export

61-90 days

Trade Integrity PRD
Algo Safe Deploy PRD
Leadership roadmap
alignment

Final interview line

“I would help Delta turn trading confidence and safer automation into a product moat.”

Source stance and limitations

Useful, honest research beats fake certainty.

- Official sources were prioritized over commentary
- App reviews are used to identify failure modes, not prevalence
- Internal data is required for final sizing and effort estimates
- Exact legal employer and role scope must be verified with Delta

Key source groups: Delta Terms, fees, Google Play, support/help articles, competitor official pages, PMLA notification and Indian tax source.
